Projet ANR Génomique MétaQTL

BioMercatorV4 Tutorial

02 February 2012

Summary

Introduction	
Data loading	3
Chromosomes display	
Individual zoom.	
Cascading zoom	6
Analyses	8
Connectivity (InfoMap)	8
Consensus map creation (ConsMap)	
QTLs projection (QTLProj)	11
QTLs Meta-analysis (QTLClust)	
First step	12
Second step	13
1 I	

Introduction

This tutorial will guide you through new functionalities and analyses in BioMercatorV3; data files used are situated in the "Tutorial_files" folder.

When launching the software for the first time, the workspace is totally empty.

Installation

BioMercator is a Java program; all you need is Java (v1.5 or above) installed on your machine.

On Windows: Double-click on the BioMercatorV4.jar to launch the program

On other OS: Open a terminal and execute the command line :

"java -jar BioMercatorV4.jar"

If the software doesn't launch or exits with a memory error, you should open a console (terminal) and type the following line :

"java -jar -Xms512m BioMercatorV4.jar"

Data loading

First, we'll load the genetic maps contained in the MetaQTL format (the standard format for BioMercatorV3 is an user friendly tabulated file, but for the moment, we'll work with data from MetaQTL XML format); the wizard is accessible through the *"File"* menu and *"Genetic data loading"* sub menu. Choose *"New project"* and name it *"data"*.

Genetic data loading 1/3		8
Choose your project		
New project	data	
Prev	Next	Cancel

Fig 1: Files loading - step 1

The next step is the files choosing; browse your files and select all files inside the "*tutorial/Genetic Files*" folder. (hold the "*shift*" or "*control*" button to select all files, or press the combined keys "Control" and "a" (replace "control" by the "*apple*" key on mac OS))

Fig 2: Files loading - step 2

The next step shows a summary on all loaded files.

Once the wizard is finished, the new maps will be displayed in the explorer on the left side, inside the chosen project.

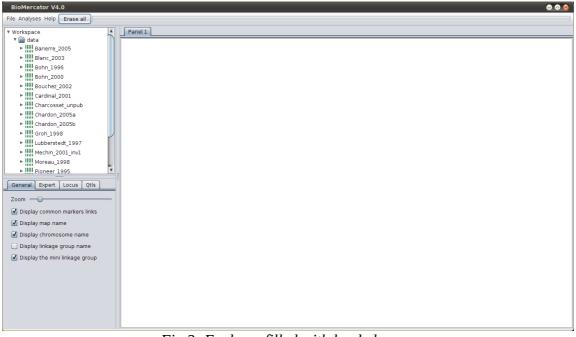

Fig 3: Explorer filled with loaded maps

Chromosomes display

For displaying a whole map, click on the map in the explorer, move the mouse in the drawing panel and release the mouse button. The whole map should appear with all chromosomes and linkage groups.

You can drag an drop a chromosome or linkage group the same way.

Drag the chromosomes '1' from '*Cardinal_2001*', '*Groh_1998*' and '*Mechin_2001_inv1*' maps to see the dynamic comparison. You see now the common markers linked with blue and red lines; red lines show the inverted markers.

Now drag the '*Mechin_2001_inv1*' from the right side to the left side of '*Groh'_1998*' by moving it (holding the mouse left button).

We see lots of inversion; right click on the '*Mechin_2001_inv1*' and select "*Reverse linkage group*"; the whole linkage group is now in the right order.

To remove an element from the display panel, you have 2 ways :

- 1. use the middle click of the mouse on the element to remove
- 2. right click on the element, then select "remove from view" in the contextual menu

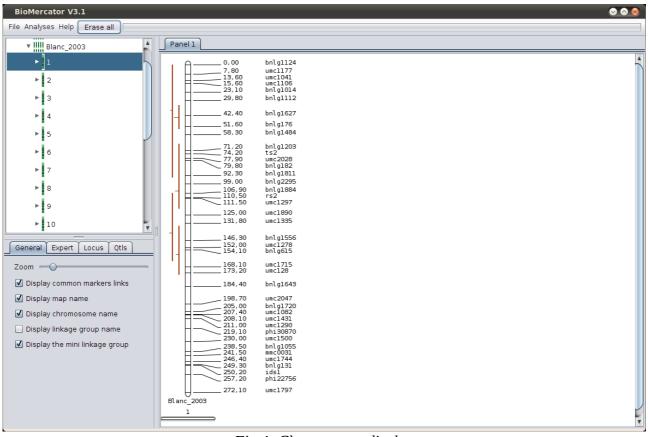

Fig 4: Chromosome display

Individual zoom

Drag several chromosomes into the display panel; now, put the mouse inside a chromosome, and use the mouse wheel; you will zoom inside the chromosome, keeping other chromosome un-zoomed. (You can also right click on the chromosome, and choose "*Zoom in/out*".

To keep an idea of your position in the chromosome, a mini-chromosome is displayed below, with a scroller indication your viewing window.

(Try this functionality a bit later on chromosomes with more markers on them.)

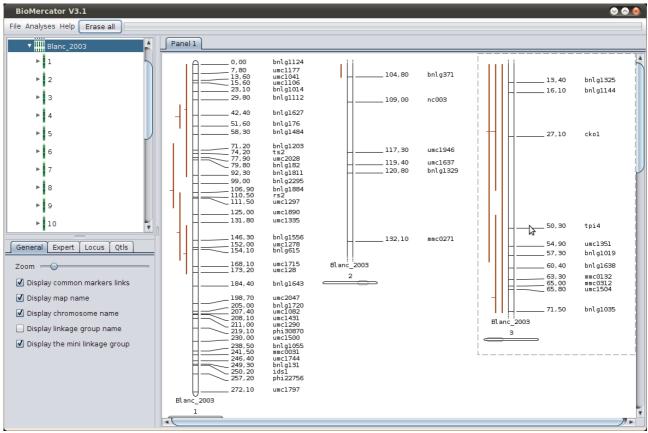

Fig 5: Individual zoom

Cascading zoom

Clear the drawing panel and drag only one chromosome. Clicking on it will launch the cascading view; a scroller appears and can be move/resized with your mouse for exploring the chromosome with more details.

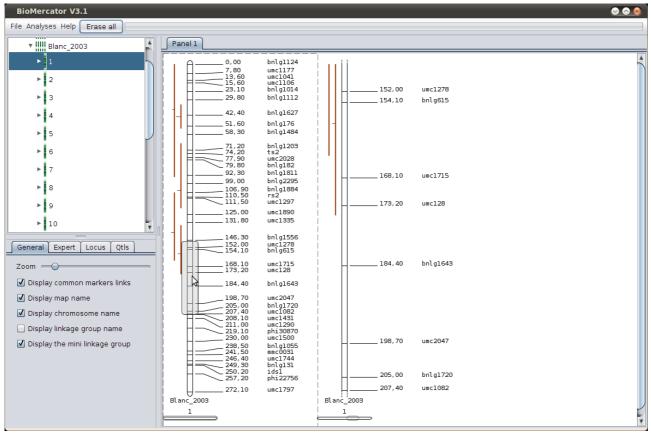

Fig 6: Cascading zoom

You can click on the zoomed chromosome for more details.

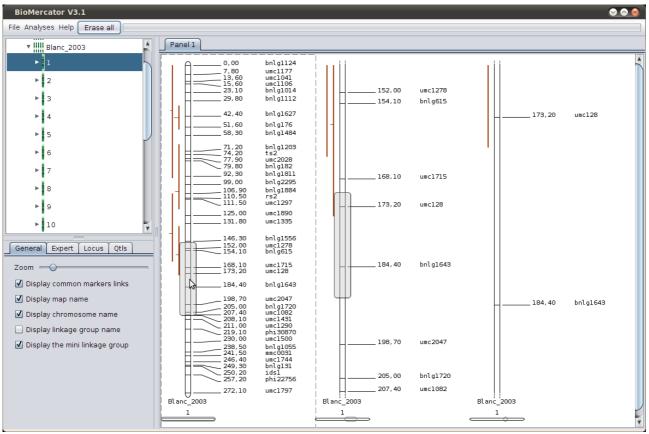

Fig 7: Cascading zoom

The zoom allows to display more information on the markers; (some markers are hidden by default when there are too many; this option can be changed in the "*Expert*" tab, below the maps explorer).

Analyses

This BioMercatorV3 version allows you to directly use command line analyses from the metaQTL toolbox. The standard workflow is the following:

- Verify connectivity between input maps
- Create a consensus map
- Launch a meta-analysis on all QTLs from the consensus map

Connectivity (InfoMap)

This method creates text files about connectivity (where dynamic comparison is only used in a visual way), in order to determine if the can be used for creating a consensus map.

- Click on "Analysis", "Statistics", "InfoMap"
- Create a project "Statistics" and validate
- Select all maps from the "Data" project
- Set the result name as "connectivity"
- Click 'Next' for launching the analysis

InfoMap 2/3			8
▼	Resu	ult name con	nectivity
	Prev	Next	Cancel

Fig 8: InfoMap analysis

Once the analysis done, you'll see 2 created files in the Statistics folder; they contain informations about markers and their connectivity.

Fig 10: InfoMap analysis - result

Consensus map creation (ConsMap)

This analysis is done in single one step, avoiding the iteration part.

- Click on "Analysis", "Map compilations", "MetaQTL Cons"
- Create a project "Consensus" and validate
- Select all maps from the "data" project
- Set the resulting map name to "pre_consensus"
- Launch the analysis

MetaQTL_Cons 2/3	8
▼ □ 🚔 Root ▶ □ 🚰 all ▶ 🗹 🚰 data	Reference map Project Map
	Result map name pre_consens
	Prev Next Cancel

Fig 11: ConsMap analysis

When the analysis finishes, a information dialog is shown; the analysis should be a success, and the resulting consensus map should be visible in the explorer. Drag it to display it; you notice that no QTL is present; the next analysis is needed.

Fig 12: ConsMap analysis - map result

QTLs projection (QTLProj)

Once the consensus map is created, use this analysis in order to project QTLs from all the maps used.

- Click on "Analysis", "Map compilations", "MetaQTL QTLProj"
- Choose the "Consensus" project and validate
- In the next window, in the left explorer, select all maps from the "data" project
- In the right explorer, select the "pre_consensus" map from the "Consensus" project
- Set the resulting map name to "consensus"
- Launch the analysis

QTLs Meta-analysis (QTLClust)

This meta-analysis is a two steps analysis; the first one calculates and estimates the best models (ie number of meta QTLs), so you can choose the one to show in the second.

First step

- Click on 'Analyses', 'QTL Meta analyses', 'MetaQTL Meta analysis 1/2'
- Choose 'meta_v1' for the meta analysis' name
- Select the 'Consensus' project
- Select the 'consensus' map
- Select the '1' chromosome
- Select the '1' linkage group
- Choose to regroup the traits into a single meta trait named 'FT' (for Flowering Time)
- Click 'Next' to launch the analysis

O Use an ont	ology file)			
		P	rev	Next	Cancel

Fig 15: Meta analysis – step 1

Once the analysis is done, browse the explorer down to the created meta analysis situated inside the previously selected linkage group (project 'Consensus', map 'consensus', chromosome '1', linkage group '1'). You'll see 3 created files; drag the one named 'meta_v1_model.txt'; it corresponds to the most probable model given different criterions.(for more explications, please refer to the 'MetaQTL' software documentation)

Fig 16: Meta analysis – first result

Second step

- Click on 'Analyses', 'QTL Meta analyses', 'MetaQTL Meta analysis 2/2'
- Select the 'Consensus' project
- Select the 'consensus' map
- Select the '1' chromosome
- Select the '1' linkage group
- Choose 'meta_v1' for the meta analysis' name
- Choose the meta trait named 'FT'
- Click 'Next' to launch the analysis
- Set '5' for the 'best' parameter

MetaQTL_QTLCI	ustinfo 1/2	_	8

	Prev	Next	Cancel

Fig 17: Meta analysis – step 2

Once the analysis is done, browse the explorer down to the created meta analysis situated inside the previously selected linkage group (project 'Consensus', map 'consensus', chromosome '1', linkage group '1'). Inside the folder, you'll see a linkage group named '1', drag it to see the meta-QTLs along with the QTLs and their percentage of belonging.

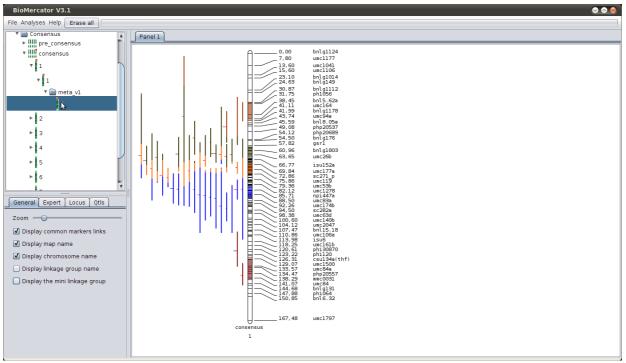

Fig 18: Meta analysis – final result

Genome version

This new software version integrates structural and functional annotation; a genome version corresponds to a structural annotation, a functional annotation and anchors between the genetic map and the sequence.

Loading a new genome version

You'll need to download 2 files corresponding to the annotation (too heavy to be included in the BioMercator package).

- The structural annotation in maize sequence (ftp link in home page)

http://ftp.maizesequence.org/current/filtered-set/ZmB73_5b_FGS.gff.gz

- The functional annotation (ftp link in home page)

http://ftp.maizesequence.org/current/functional-annotations/ZmB73_5a_xref.txt.gz

Once downloaded, extract them into the 'tutorial/Physic Files' folder.

Click in the menu: 'File/New genome version';

Choose a name for the genome version ('maize_1')

Click on browse for the structural annotation, and choose the '*ZmB73_5b_FGS.gff* file

Fig 19: Genome version loading - Structural annotation

The wizard show you the first lines in the file; it is set by default to use a GFF3 file, so you don't need to change anything; just click on Finish.

Now, click on browse for the functional annotation, and choose the '*xref.txt*' file.

As before, just click finish as the columns are in the right order.

At last, click on browse for the anchors and choose the 'anchors.csv' file.*

Fig 23: Genome version loading

Display a new genome version

We're now going to display the new genome version; in the tab '*Genome Version*' select 'maize_1'; a progress bar should appear; wait until it's completely loaded.

Drag the linkage group from the explorer: Consensus/consensus/1/1/meta_v1 and unselect the QTLs display under the QTL tab (for a clearer view).

Drag the scroller on the genetic map, and you'll see it move along the sequence (vertical line in the middle), as well as the genes under the selected area (on the right side).

As the ratio between cM and bp isn't always the same, look at the scroller's size on the sequence as you move the other one on the genetic map. (you can also resize the scoller or move the other one)

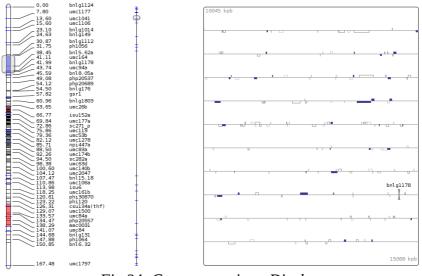

Fig 24: Genome version - Display

Click then on the first meta-QTL. The Cursor is positioned automatically around it.

Now, in the 'View' menu, choose '*Show the GO view*'. A panel appears at the bottom. The colors shown in the chart represent the Gene Ontology terms, and are used for the genes color; clicking on a chart section will enlighten the corresponding genes, and clicking a

second time (not a double-click) will make you go deeper in the GO hierarchy.

Analyzing GO over/under-representation

Another tool in BioMercator is the GO representation analysis; select the Analysis tab in the new panel, check the scroller is situated around the first metaQTL (click on the metaQTL if not) and just launch the analysis.

The analysis gives you a list of GO terms over and under represented in the selected area (here, the meta-QTL) compared to the whole linkage group. The columns gives you more information about the term. Clicking on it will enlighten the genes with the corresponding annotation.

Other analysis parameters are available, you could decide to analyze the representation along all intervals of a trait compared to the whole genome for instance.

Fig 26: Genome version - GO analysis

Finally you can export genes into GFF3 file;

Right click on the genes window, and select 'Export to GFF'.

You can export all features or only genes.

You can choose the window of export (just the scroller's area, the whole chromosome or the whole genome).

And you can choose to export only genes with the corresponding GO functional annotation.

Browse to select the path of your new file, and click next.

You'll see in the created GFF the genes with all the structural annotation, but with also the GO annotation. The QTLs and meta-QTLs will be present in the GFF file.
