1 Overall quality at a glance (i)

The following experimental techniques were used to determine the structure: $SOLUTION\ NMR$

The overall completeness of chemical shifts assignment is 33%.

Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric | $egin{array}{c} { m Whole \ archive}\ (\#{ m Entries}) \end{array}$ | ${f NMR} { m archive} \ (\#{ m Entries})$ |
|-----------------------|---|--|
| Clashscore | 158937 | 12864 |
| Ramachandran outliers | 154571 | 11451 |
| Sidechain outliers | 154315 | 11428 |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the experimental data. The red, orange, yellow and green segments indicate the fraction of residues that contain outliers for >=3, 2, 1 and 0 types of geometric quality criteria. A cyan segment indicates the fraction of residues that are not part of the well-defined cores, and a grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions <=5%

| Mol | Chain | Length | Quality of chain | | | |

4 Residue-property plots (i)

4.1 Average score per residue in the NMR ensemble

These plots are provided for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic is the same as shown in the summary in section 1 of this report. The second graphic shows the sequence where residues are colour-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outliers are shown as green connectors. Residues which are classified as ill-defined in the NMR ensemble, are shown in cyan with an underline colour-coded according to the previous scheme. Residues which were present in the experimental sample, but not modelled in the final structure are shown in grey.

| Software name | Classification | Version |
|---------------|-----------------------|---------|
| GROMACS | structure solution | 3.3.1 |
| GROMACS/CPMD | geometry optimization | |

| Number of chemical shift lists | 1 |
| Total number of shifts | 142 |
| Number of shifts mapped to atoms | 142 |

6 Model quality (i)

6.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: ACE, ZN, NH2

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with |Z| > 5 is considered an outlier worth inspection. RMSZ is the (average) root-mean-square of all Z scores of the bond lengths (or angles).

| Mol | Chain | Bond lengths B | | | Bond angles |
|-------|-------|-------------------|---------------------------------|-------------------|---------------------------------|
| IVIOI | Chain | RMSZ | $\#Z{>}5$ | RMSZ | #Z > 5 |
| 1 | А | $0.66 {\pm} 0.01$ | $0{\pm}0/134~(~0.0{\pm}~0.0\%)$ | $0.99 {\pm} 0.05$ | $0{\pm}0/177~(~0.0{\pm}~0.1\%)$ |
| 1 | В | $0.66 {\pm} 0.01$ | $0{\pm}0/134~(~0.0{\pm}~0.0\%)$ | $0.98 {\pm} 0.06$ | $0{\pm}1/177~(~0.2{\pm}~0.3\%)$ |
| All | All | 0.66 | 0/5360~(~0.0%) | 0.99 | 7/7080~(~0.1%) |

Chiral center outliers are detected by calculating the chiral volume of a chiral center and verifying if the center is modelled as a planar moiety or with the opposite hand. A planarity outlier is detected by checking planarity of atoms in a peptide group, atoms in a mainchain group or atoms of a sidechain that are expected to be planar.

| Mol | Chain | Chirality | Planarity |
|-----|-------|---------------|---------------|
| 1 | А | $0.0{\pm}0.0$ | 1.2 ± 0.4 |
| 1 | В | $0.0{\pm}0.0$ | $0.7{\pm}0.6$ |
| All | All | 0 | 38 |

There are no bond-length outliers.

All unique angle outliers are listed below. They are sorted according to the Z-score of the worst occurrence in the ensemble.

7.1.4 Statistically unusual chemical shifts (i)

There are no statistically unusual chemical shifts.

7.1.5 Random Coil Index (RCI) plots (i)

The image below reports *random coil index* values for the protein chains in the structure. The height of each bar gives a probability of a given residue to be disordered, as predicted from the available chemical shifts and the amino acid sequence. A value above 0.2 is an indication of significant predicted disorder. The colour of the bar shows whether the residue is in the well-defined core (black) or in the ill-defined residue ranges (cyan), as described in section 2 on ensemble composition. If well-defined core and ill-defined regions are not identified then it is shown as gray bars.
